1. Introduction

Circadian Calm is a fictional educational wellness brand created as part of this semester project. The purpose of the brand is to provide structured, research-informed guidance to night shift workers who struggle with sleep regulation, recovery, and daily functioning.

The inspiration for this project came from real-life professional experience. As a caring assistant (also known as a Brukerstyrt Personlig Assistent in Norwegian), I primarily work night shifts. This exposed me to the practical challenges shift workers face, including disrupted circadian rhythms, fatigue, and inconsistent recovery routines.

This positioned Circadian Calm as:

An educational support hub for night shift workers seeking structured recovery guidance.

2. Analysis and Strategy

Target Audience

The primary audience consists of:

- Night shift healthcare workers
- Care assistants
- Emergency staff
- Shift-based service workers

These individuals often experience:

- Irregular sleep cycles
- Fatigue
- Lifestyle imbalance
- Poor recovery routines

They require:

- Practical guidance
- Clear structure
- Accessible information

Buyer Persona

Name: Lina

Age: 29

Occupation: Night Shift Healthcare Assistant

Pain Points:

- Difficulty sleeping after shifts
- Fatigue on days off
- Lack of structured recovery routines

Goals:

- Improve sleep quality
- Reduce burnout
- Build consistency

Competitor Landscape

Competitors typically include:

- Generic sleep blogs
- Wellness websites
- Health education platforms

However, these are usually designed for daytime populations and do not address night shift-specific challenges.

Circadian Calm fills this gap by focusing specifically on Shift-worker recovery behaviour.

Brand Identity

Mission:

To provide structured, accessible sleep and recovery guidance for night shift workers.

Vision:

To support long-term well-being through behaviour-based education.

Values:

- Practicality
- Clarity
- Consistency
- Accessibility

Tone of voice:

Supportive, structured, and informative.

SMART Goal

To create an educational hub that encourages night shift workers to engage with structured recovery routines through downloadable guidance and informational content.

3. Content Creation

The strategy was designed to support the buyer journey;

Awareness → Education → Action

Three formats were selected:

1. Blog Post (Education)
2. Landing Page (Conversion)
3. Email Sign-Up (Engagement)

Content Format 1: Blog Post

Title: How to Sleep After a Night Shift

Purpose: To educate shift workers on recovery strategies using structured sleep guidance.

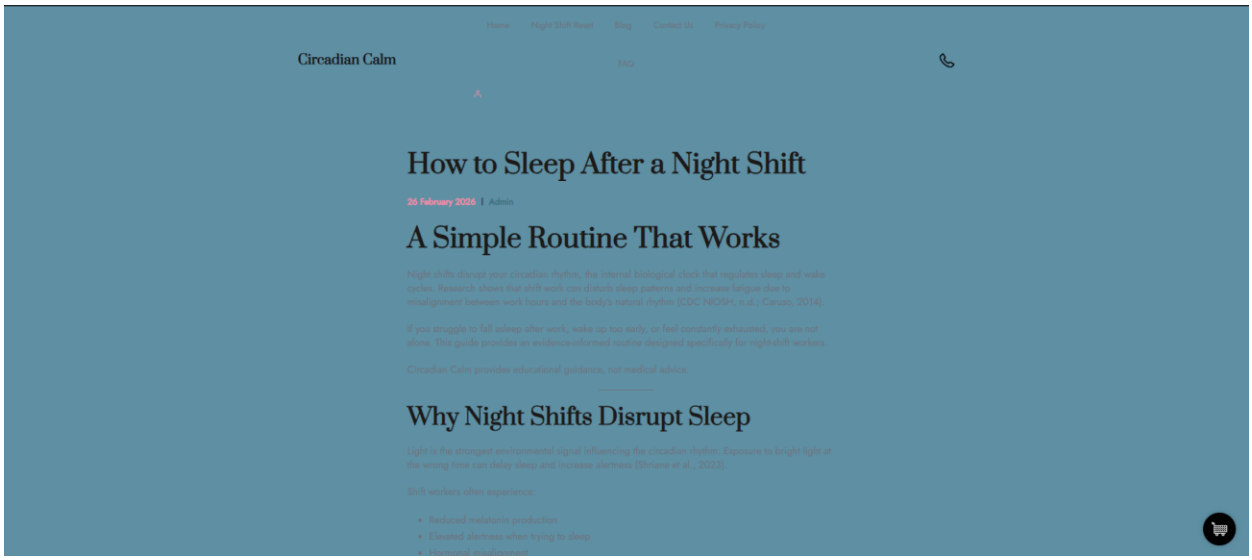
Includes:

- Light exposure management
- Caffeine timing
- Sleep window consistency
- Recovery routines

Research-informed references were used.

This blog post was designed specifically for the needs identified in the buyer persona, particularly addressing challenges such as difficulty sleeping after nightshifts and lack of structured recovery routines.

Blog Post Live



- Reduced melatonin production
- Elevated alertness when trying to sleep
- Hormonal misalignment
- Increased fatigue risk

Understanding this biological conflict helps explain why consistency and light management are essential.

The 6-Step Post-Shift Sleep Routine

1. Protect Your Light Exposure After Your Shift

NIOSH guidance for shift workers recommends limiting bright light exposure after a night shift to help the body prepare for sleep (CDC NIOSH, 2020).

Practical strategy:

- Wear dark sunglasses on your commute home if it is bright
- Keep indoor lighting dim once home
- Avoid prolonged screen exposure before bed

Reducing light signals to the brain can help support the transition toward sleep.

---

2. Set a Caffeine Cut-Off Time

Research demonstrates that caffeine consumed even six hours before bedtime can significantly disrupt sleep (Drake et al., 2013).

A practical guideline:
Stop caffeine intake at least 6 hours before your planned sleep window.

For example, if you aim to sleep at 09:30, avoid caffeine after 03:30.

For example, if you aim to sleep at 09:30, avoid caffeine after 03:30.

---

3. Create a Dark, Quiet, Cool Sleep Environment

Sleep hygiene research consistently highlights the importance of a dark, quiet, and cool bedroom environment (Sleep Foundation, 2025).

Helpful adjustments:

- Blackout curtains or eye mask
- White noise machine or earplugs
- Bedroom temperature around 18℃

These environmental adjustments are particularly important for daytime sleepers.

---

4. Choose a Consistent Sleep Window

Maintaining a consistent sleep window can support more regular sleep patterns over time (Chow, 2022).

Instead of sleeping randomly, choose a repeatable window such as:

09:30–15:30 after night shifts

While full alignment is difficult with rotating shifts, consistency where possible supports better adaptation.

---

5. Manage Days Off Carefully

Avoid large swings in your sleep schedule on days off, as abrupt shifts between day and night patterns can increase circadian misalignment (CDC NIOSH, 2020).

Frequently Asked Questions

How many hours should I sleep after a night shift?

Most adults are recommended to obtain at least 7 hours of sleep within a 24-hour period for optimal health (Watson et al., 2015). For shift workers, this may occur as one core sleep period or be split across multiple sleep opportunities.

Is this medical advice?

No. Circadian Calm provides educational information based on publicly available health guidance and research.

Content Format 2: Landing Page

Title: Night Shift Reset Checklist

Purpose: Lead generation through structured downloadable recovery guidance.

The checklist was developed to provide structured behavioural guidance for individuals like the defined buyer persona, who require simple and actionable recovery support.

Includes:

- Recovery checklist
- Structured routine steps
- Call-to-action
- Email capture form

Landing Page

Content Format 3: Email Sign-Up

Purpose: To collect subscriber emails for future educational communication.

Form placed directly within the landing page.

Circadian Calm
FAQ
How much sleep should night shift workers aim for?
Most adults require 7–9 hours of sleep within a 24-hour period (Watson et al., 2015).
Why is consistent sleep timing important?
Maintaining consistent sleep timing supports circadian rhythm stability (Chow, 2022).
Does caffeine affect recovery sleep?
Caffeine consumed within 6 hours of sleep may disrupt sleep quality (Drake et al., 2013).
Why does light exposure matter after shifts?
Reducing light exposure supports daytime sleep (CDC NIOSH, 2020).

4. Evaluation and Discussion

Branding Implementation

Circadian Calm used:

- Consistent tone
- Focused messaging
- Behavioural structure

The structure and simplicity of the content formats were influenced by the buyer persona's need for clarity and practicality.

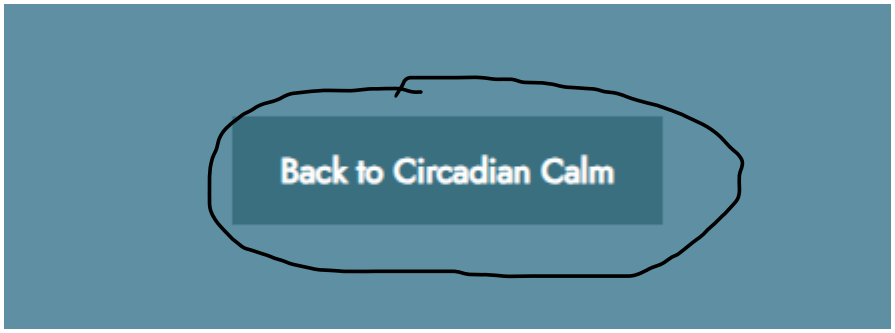
Homepage Branding

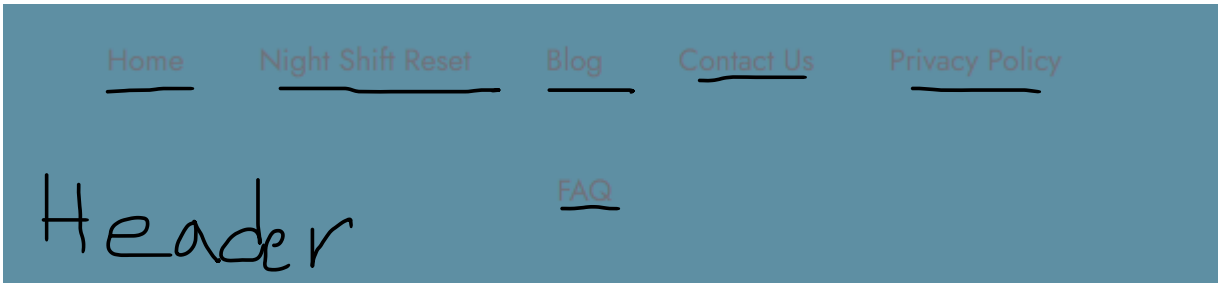
Usability

Applied principles:

- Simple navigation
- Clear CTAs
- Readable layout

Navigation Example



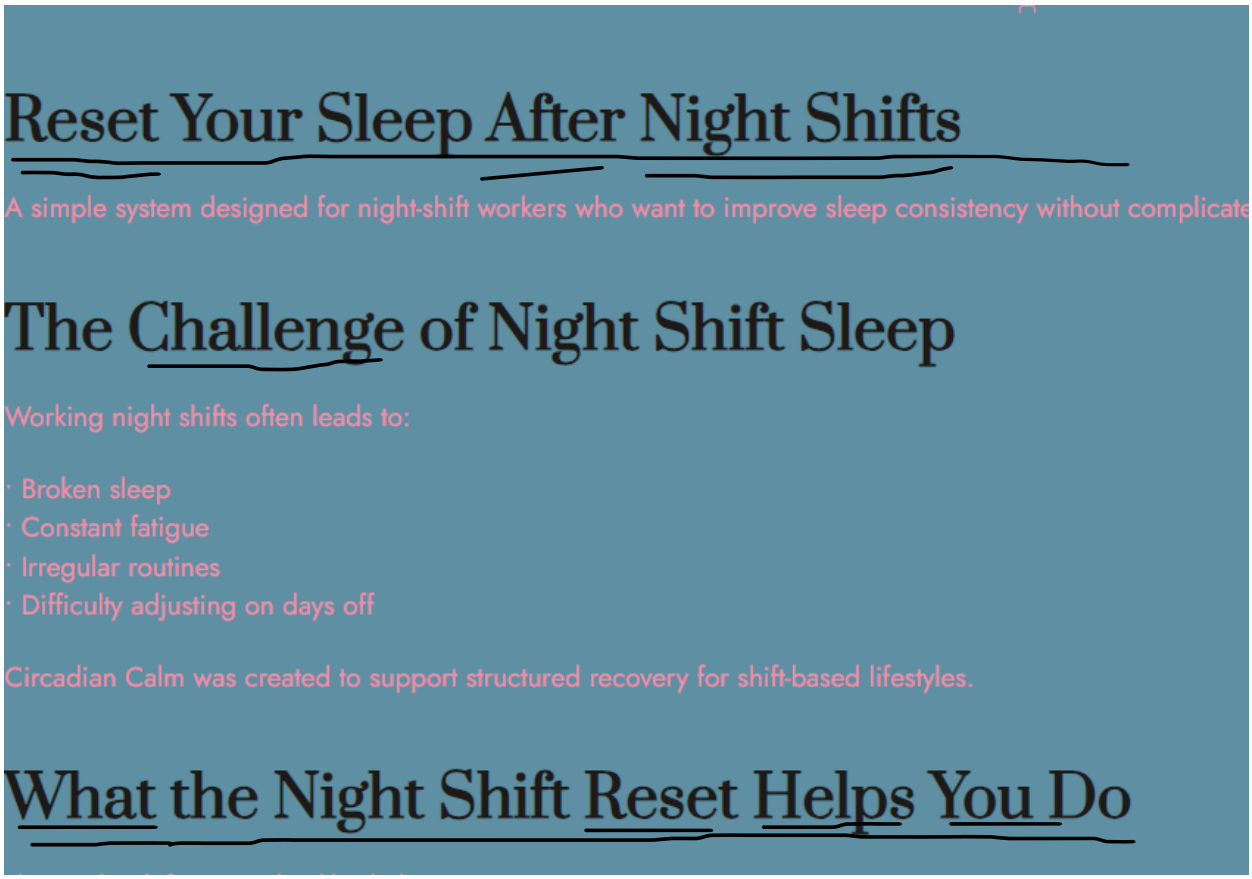


Accessibility

Considerations included:

- Colour contrast
- Clear headings
- Structured layout

Readable Layout



SEO Implementation

On-page SEO included:

- Keyword use
- Structured headings
- Internal linking

How to Sleep After a Night Shift

26 February 2026 | Admin

A Simple Routine That Works

Night shifts disrupt your circadian rhythm, the internal biological clock that regulates sleep and wake cycles. Research shows that shift work can disturb sleep patterns and increase fatigue due to misalignment between work hours and the body's natural rhythm (CDC NIOSH, n.d.; Caruso, 2014).

If you struggle to fall asleep after work, wake up too early, or feel constantly exhausted, you are not alone. This guide provides an evidence-informed routine designed specifically for night-shift workers.

Circadian Calm provides educational guidance, not medical advice.

Why Night Shifts Disrupt Sleep

Light is the strongest environmental signal influencing the circadian rhythm. Exposure to bright light at the wrong time can delay sleep and increase alertness (Shriane et al., 2023).

Shift workers often experience:

- Reduced melatonin production
- Elevated alertness when trying to sleep
- Hormonal misalignment
