To evaluate the usability and accessibility of my website, I used the **WAVE Web Accessibility Evaluation Tool by WebAIM**. This tool analyses web pages and highlights accessibility and usability issues that may affect real users.

The WAVE report gave my website an **AIM score of 6.7/10**, and identified several areas that can be improved.

Key issues discovered

1. Missing alternative text on images

The tool identified that at least one linked image is missing *alt text*. This means screen readers cannot describe the image to visually impaired users. This is an important accessibility issue because images are a major part of the website's content.

Improvement:

I would add descriptive alt text to all product and decorative images to make the site accessible for screen readers.

2. Colour contrast issues (9 contrast errors)

The tool reported several colour contrast warnings. This means some text may be difficult to read for users with visual impairments or colour-blindness.

Improvement:

I would adjust text and background colours to increase contrast and improve readability across the site.

3. Accessibility alerts and structure warnings

The tool flagged alerts related to page structure and ARIA labels. While not critical errors, they suggest improvements for navigation and assistive technologies.

Improvement:

I would refine heading structure and navigation labels to improve clarity and usability.

Overall evaluation

This test showed that my website is visually functional and usable, but still needs accessibility improvements. Using WAVE helped me understand how real users with disabilities may experience my website and highlighted practical steps for improvement.

Below are screenshots of the testing.

WAVE Web Accessibility Evaluation Tools
WAVE® is a suite of evaluation tools that helps authors make their web content more accessible to individuals with disabilities. WAVE can identify many accessibility and Web Content Accessibility Guideline (WCAG) errors, but also facilitates human evaluation of web content. Our philosophy is to focus on issues that we know impact end users, facilitate human evaluation, and to educate about web accessibility.

Additional Website Performance and SEO Testing

In addition to accessibility testing, I also evaluated the website's performance and search engine optimisation using built-in hosting tools and WordPress plugins.

Performance testing (One.com Performance Monitor)
The One.com performance monitor was used to analyse the technical performance of the website.

The results showed:

- Performance: 67
- Accessibility: 95
- Best practices: 79
- SEO: 58 (improved)

These results show that the website performs well in accessibility and general best practices, while performance and SEO can still be improved in future iterations.

Beow are screenshots of the One.com performance monitor, of before and after improvements.

SEO testing (RankMath)
The RankMath SEO plugin was used to optimise the homepage content and improve search engine visibility.

When I first analysed the homepage, the SEO score was **22/100**, which indicated that the page was missing key SEO elements such as a focus keyword, meta description optimisation, and keyword placement within the content.

After applying SEO improvements such as:

- adding focus keywords
- optimising the SEO title and meta description
- improving keyword placement in headings and content

the homepage SEO score increased to **88/100**.

This improvement clearly demonstrates how structured SEO optimisation can significantly improve a website's search visibility and content quality.

Below are photos of rankmath.
My laptop began to slow down and crash several times, so I sadly had to take some photos on my phone to show the before and after.

Future Improvements and Next Steps

After completing accessibility, performance, and SEO testing, I noticed several areas that could be improved further. Firstly, I realised that all images should include more descriptive alternative text to make the site more accessible for screen readers. I also noticed that some colour contrasts could be improved to make the text easier to read for users with visual impairments.

Secondly, I discovered that website performance could be improved by optimising image sizes and reducing unnecessary scripts to help the pages load faster.

Finally, I learned that SEO work is an ongoing process. In the future, I would continue expanding keyword usage across more pages and improve internal linking to strengthen the website's visibility in search engines.

Overall, this testing helped me understand that usability, accessibility, and SEO are not one-time tasks but something that should be improved continuously as the website grows.
